

How To Synchronize Calendars and Tasks With iOS Devices Using The MDAemon CalDAV Service

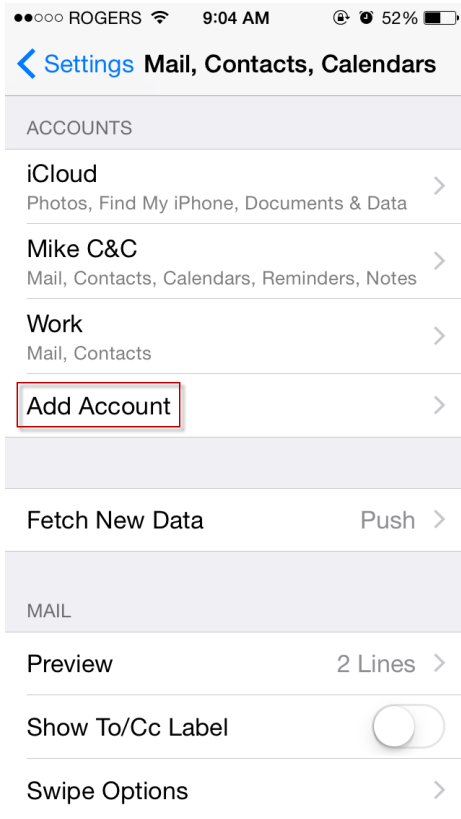

With the release of MDAemon v15.5.0 iOS users can now sync calendars and tasks with MDAemon using MDAemon’s new CalDAV service.

Follow the below instructions to configure calendar and/or task sync’ing on iOS devices.

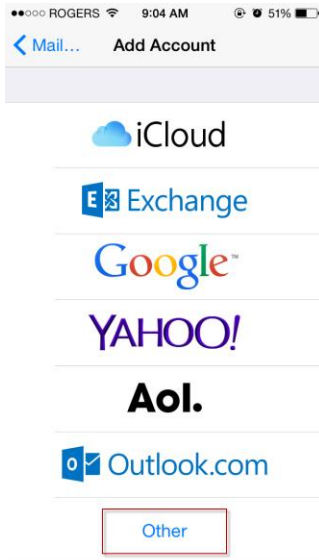

1. On the iOS device touch Settings and then “Mail, Contacts, Calendars”.

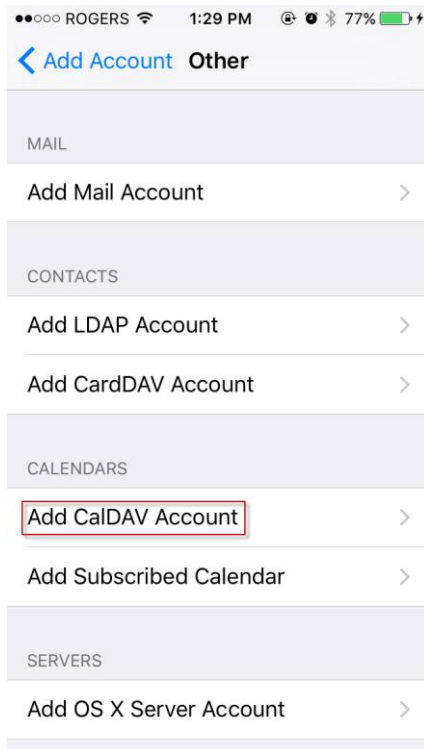

2. Touch on "Add Account".

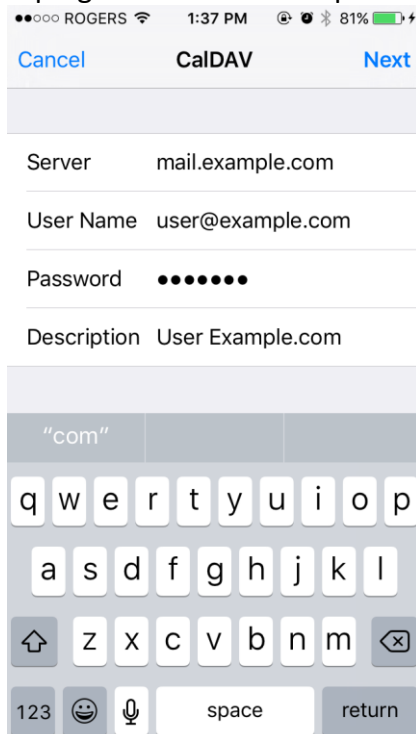

3. Touch "Other".

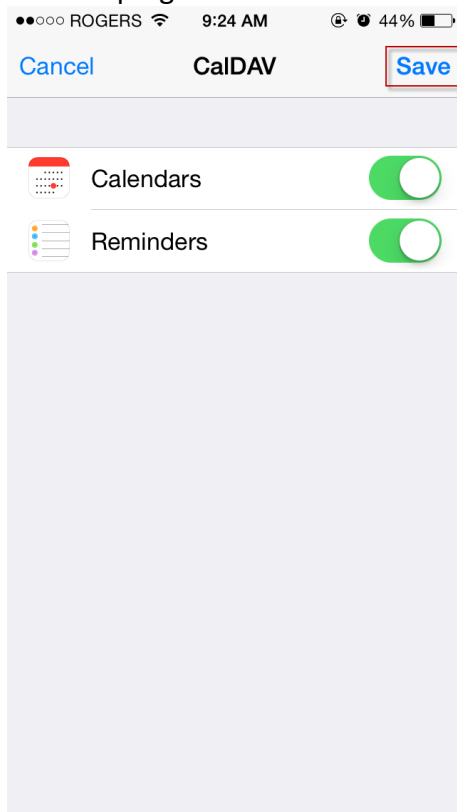

4. Touch "Add CalDAV Account".

5. Complete the Server, User Name, Password, and Description fields. Touch Next in the top right hand corner. Replace "mail.example.com" with your own host name.

6. Choose Calendars and/or Reminders (aka Tasks) to sync with the device and touch Save in the top right hand corner.

Please note that the calendars and/or tasks will not be added, and accessible, from the devices native Calendar and/or Reminder applications. Meaning calendar events and/or reminders already on the iOS device will not get sync'd to the server.
